

# GitHub Instructions

1. Access teamByteMe1/mobileAppDev repository, select fork In top right hand corner and choose your GitHub Username

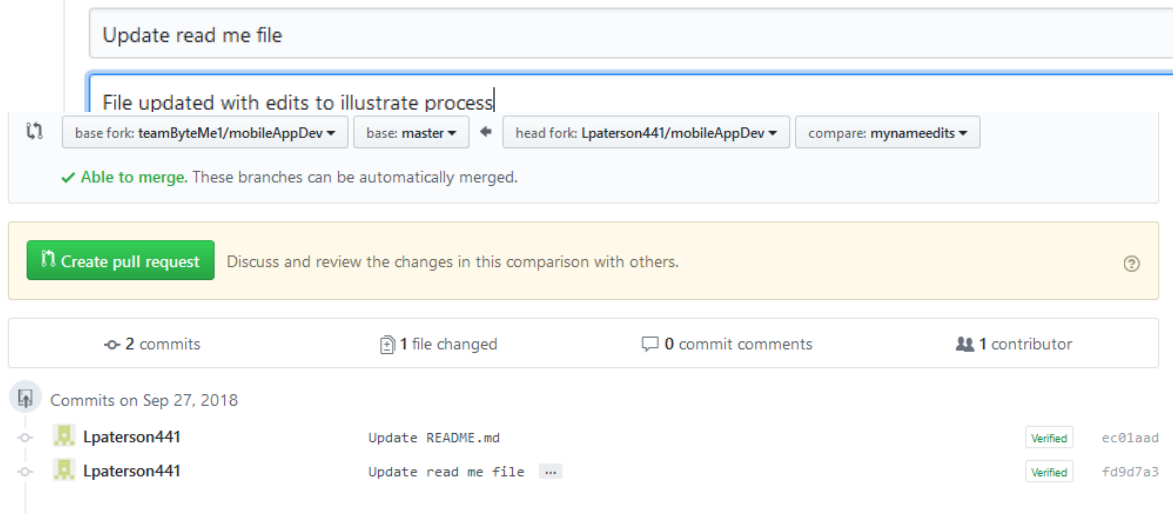

Forking will copy across the entire repository so all files and code will now be in your fork. Github will automatically redirect you to your forked repository.

2. When you want to start editing files navigate to <Code> tab and find Branch:master and click on the drop down menu. You will see it currently only says master. Start typing in the name of your new branch, something like MyName-edits and hit enter to create branch.

2. You now have a new branch called MyName- edits, here you can make any changes you want to any of the files and only the edits branch will be changed. Once you have modified your chosen file fill in the details at the bottom of the page for committing a change.
3. Now navigate to the pull request tab at the top of the page and select new pull request.

Github will display the base fork and the fork you are currently working on. Make sure you are in the correct branch also ie MyName-edits.

4. You will have to name your pull request and fill in information about your pull request. Preferably put some detail in here so that group members will be able to see any changes you have made and why.
5. When you hit enter pull request Rom will get a pull request on the main group repository essentially asking him if its ok to update the main repository with this new file.
